APPLICANT: Narks, Daniel L.
APPLICANT: Cone, Roger D.
TITLE OF INVENTION: Methods and Reagents for Discovering and Using
TITLE OF INVENTION: Methods and Mean alocation Receptor Antagonists to Treat
TITLE OF INVENTION: Cachexia
FILE REFERENCE: 96-886
CURRENT APPLICATION NUMBER: US/10/074,754
CURRENT PILING DATE: 2002-02-13
NUMBER OF SEQ ID NOS: 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NAME/KEY: SITE
LOCATION: (4)
FORMATION: "Xaa" is naphthyl-D-alanine
FERATURE:
OTHER INFORMATION: Description of Artificial Sequence: peptide
OTHER INFORMATION: cyclized between the epsilon amino group of the
OTHER INFORMATION: lysine and the sidechain carboxyl group of the
OTHER INFORMATION: aspartic acid
                                                                                                                                             ö

Sequence 3, Application US/09953349
Patent No. US20020099014A1
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
Miles
APPLICANT: Brennan
TITLE OF INVENTION: Method for Treatment of Insulin Resistance in Obesity and Diabetes
TITLE OF INVENTION: Method for Treatment of CURRENT APPLICATION NUMBER: US/09/953,349
CURRENT FILING DATE: 2001-09-13
FRIOR PELING DATE: 2000-09-13
NUMBER OF SEQ ID NOS: 8
SOFTWARE: Patentin Version 3.0
                                                                                                                                                                                                                                                                                                                                                                      Sequence 1, Application US/10297976

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Peptides 9:429-431 (1988).

-!- FUNCTION: This peptide hormone induces gall bladder contraction and the release of pancreatic enzymes in the gut. Its function in the brain is not clear.

-!- SIMILARITY: Belongs to the gastrin/cholecystokinin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          SEQUENCE, AND MASS SPECTROMETRY (CAERULEINS 1.2 AND 1.274).

Bur. J. Biochem. 267:269-275(2000).

-!- FUNCTION: Hypotensive neuropeptide (Probable).

-!- SIBCELIULAR LOCATION: Secreted.

-!- TISSUE SPECIFICITY: Skin dorsal glands.

-!- PTM: Isoform 1.274 differs from isoform 1.2 in not being sulfated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PYRROLIDONE CARBOXYLIC ACID

1 Subschiultak LOCATION: Secreted.

1 TISSUB SPECIFICITY: Expressed by the venom duct.

1 PTM: The cis isomer is the most abundant and is thus thought to be the functionally relevant conformer.

1 MASS SPECIFOMETRY: MW-1088.6; METHOD=MALDI.

1 SIMILARITY: Belongs to the contryphan family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Biochem. Biophys. Res. Commun. 160:850-856(1989).
Biochem. Biophys. Res. Commun. 160:850-856(1989).

-!- FUNCTION: Muscle inhibiting agent. Involved in the neural control of the visceral muscles of the heart, accessory glands and oviduct. May be involved in the regulation of saliva secretion.

-!- TISSUB SPRCIFICITY: Found in axons of the male accessory glands, the salivary glands, the heart, and the oviduct.

-!- SIMILARITY: Belongs to the FARP (FMRPamide related peptide)
family.

Nature Jinked glycan consists of GlC-GlC-Glc trisaccharide.
-!- PTM: S-linked glycan consists of the glycoprotein from which this peptide is derived is unknown. No physiological function has been
                                                                                                                                                                                                                                                                                                                                                               Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                         "Neuroactive peptides with an RFamide or Famide carboxyl terminal.";
Comp. Biochem. Physiol. 102C:213-222(1992).
-!- SIMILARITY: Belongs to the FARP (FMRFamide related peptide)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrope insularis snake venom.";

J. Protein Chem. 9:221-227 (1990).

-!- FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.

It acts as an indirect hypotensive agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

(ALPHA, BETA AND GAMMA), LINKED TO EACH OTHER BY DISULFIDE BONDS.

--- PTM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinopeptides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot.

Anastasi A., Montecucchi P.C., Angelucci F., Erspamer V., Endean R., "Glu (OMe) 3-litorin, the second bombesin-like peptide occurring in methanol extracts of the skin of the Australian frog Litoria aurea."; Experientia 33:1289-1289(1977).

-I. SUBCELLULAR LOCATION: Secreted.
-I. TISSUE SPECIFICITY: Skin.
-I. SIMILARITY: Belongs to the bombesin/neuromedin B/ranatensin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PROSITE; PS00257; BOMBESIN; 1.

Gaede G., Rosinski G.;

"The primary structure of the hypertrehalosemic neuropeptide from tenebrionid beetles: a novel member of the AKH/RPCH family.";

Peptides 11:455-459(1990).

-I- FUNCTION: Hypertrehaloseamic factors are neuropeptides that elevate the level of trehalose in the hemolymph (trehalose is the major carbohydrate in the hemolymph of insects).

-I- SUBCELLUIAR LOCATION: Secreted.

-I- SIMILARITY: Belongs to the AKH / HRTH / RPCH family.

PIR; A43976; A43976.
"The metabolic neuropeptides of the corpus cardiacum from the potato beetle and the American cockroach are identical."; Peptides 10:1287-1289(1989).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-MAY-1992 (Rel. 22, Created)

Gaede G., Rinchart K.L. Jr.;

Thimary structures of hypertrehalosaemic neuropeptides isolated from the corpora cardiaca of the cockroaches Leucophaea maderae,

The corpora cardiaca of the cockroaches Leucophaea maderae,

The corpora cardiaca of the cockroaches Leucophaea maderae,

The mad of the stick insect Extatosoma tiaratum assigned by tandem fast atom bombardement mass spectrometry.";

Biol. Chem. Hoppe-Seyler 371:345-354 (1990).

L. FUNCTION: Hypertrehalosaemic factors are neuropeptides that clevate the level of trehalose in the hemolymph (trehalose is the major carbohydrate in the hemolymph of insects).

C. -- SIMILARITY: Belongs to the AKH / HRTH / RPCH family.

Proc. Natl. Acad. Sci. U.S.A. 89:2326-2330(1992).

-!- FUNCTION: Able to induce fluid secretion from the isolated salivary gland of Calliphora.

-!- SIMILARITY: Belongs to the FARP (FMRFamide related peptide) family.

Proc. Natl. Acad. Sci. U.S.A. 89:2326-2330(1992).
-!- FUNCTION: Able to induce fluid secretion from the isolated salivary gland of Calliphora.
-!- SIMILARITY: Belongs to the FARP (FWRFamide related peptide)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .,

                                                              "Angiotensin-converting enzyme inhibitors from the venom of Both jararaca. Isolation, elucidation of structure, and synthesis."; Biochemistry 10:4033-4039(1971).

--- FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.

It acts as an indirect hypotensive agent.
                                                                                                                                                                                                                  PIR; A01255; XAVI6B.

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";

J. Protein Chem. 9:221-227(1990).

-1- FUNCTION: This peptide both inhibits the activity of the angiotenain-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.

It acts as an indirect hypotensive agent.

Primary structure and biological activity of bradykinin potentiating heptides from Bothrops insularis snake venom.";
J. Protein Chem. 9:221-227(1930).
-!- FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.

It acts as an indirect hypotensive agent.
PIR; H37196; H37196.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent Disclosure; Page 201; 733pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidy) and maleimido groups) attached to reactive group (II) (e.g. succinimidy) and maleimido groups) attached to conserve the maino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physical processes intracellular uptake and interference with physiciogical processes.
                                                                                                                                                               .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The analogues are more potent and/or last longer than alpha-MSH and/or are more resistant to degredation by blood serum enzymes. They may be useful than alpha-MSH in diagnosis, therapy and research into hypopigmentation dysfunctions etc. (Updated on 25-MAR-2003 to correct PI
